HOME OXYGEN REFERRAL

This referral procedure is for infants with continuing oxygen requirements deemed medically ready for discharge home.

The **Safety in Air Test** is completed to determine whether an oxygen dependent infant being considered for discharge on home oxygen is able to maintain his/her oxygen saturations at a safe level (i.e. $\text{SaO}_2 > 80\%$) during disconnection from oxygen for a period of up to 4 hours. It is designed to ascertain how an infant would respond in the case of accidental disconnection from oxygen in the home environment.

KEY POINTS

- Parents must be willing and able to accept the discharge home of their infant on home oxygen therapy.
- A medical consultant must complete and fax a **MR035 - Consultation report and request** form to Respiratory Medicine Department at PMH.
- A medical consultant must order the Safety in Air test.
- The Safety in Air test is ideally performed at night when there are fewer disruptions in the nursery and therefore the infant is less likely to be disturbed when sleeping.
- The Safety in Air test should be conducted over a 4-hour period (usual time between feeds) unless the infant fails the test criteria earlier.
- On completion of the test liaise with the PMH Respiratory Team regarding review of the infant and/or test result.
- The PMH Respiratory Team will determine the result of the Safety in Air test.
