Aim

- To provide early recognition and management of hypoglycaemia in infants at risk.
- Establish criteria for admission to SCN for NGT feeds, IV dextrose or for further investigation.
- Establish criteria for cessation of blood sugar monitoring.

Asymptomatic hypoglycaemia is a common transient problem in most neonates. Symptomatic hypoglycaemia is an emergency and requires intravenous treatment.

Symptoms include:

- CNS excitation: irritability, jitteriness, seizures.
- CNS depression: hypotonia, lethargy, poor feeding, apnoeas.
- Non-specific: temperature instability, sweating, tachycardia.

The fetus under normal conditions derives all its glucose from the mother. At birth all infants must initiate glucose production and absorption. Most are able to mobilise glycogen, initiate gluconeogenesis and produce glucose at a rate of 4-6mg/kg/min. This is usually adequate to maintain euglycaemia - normal blood glucose.

**The definition used at KEMH and PCH for hypoglycaemia is a blood glucose of <2.6mmol/L.**
Causes/Risk Factors for Hypoglycaemia

</table>

The cause/risk factors for hypoglycaemia can be divided into:

Persistent or recurrent hypoglycaemia (≥ 2 episodes of hypoglycaemia) warrants further investigation. It is commonly caused by hyperinsulinism secondary to maternal diabetes however other differentials should be considered such as Congenital Adrenal Hyperplasia, syndromes and inborn errors of metabolism.

Infants at Risk of Hypoglycaemia

It is important to explain to the parents of at-risk infants that their infant is more likely than others to develop hypoglycaemia, and that their infant will need close monitoring of blood glucose. Refer to Quick Reference Guide below.

Infants at risk of hypoglycaemia that require early energy provision and BGL/PGL monitoring:

- Infants of mothers with diabetes (insulin-dependent, type 2 DM or GDM).
- Infants small for gestational age (<10th centile) refer to Appendix 1
- Preterm infants (<37 weeks gestation)
- Infants large for gestational age (>97th centile) refer to Appendix 1
- Infants of mothers who received antenatal corticosteroids > 34 wks gestation.
- Infants of mothers who received beta blockers in 3rd trimester.

Early Energy Provision - Within 1-2 Hours of Birth

- Offer early skin-to-skin under warm blankets.
- Encourage early first breast feed followed by 3 hourly feeds/more frequent if demanding.
- If poor breast feeding, consider supplemental enteral feeding 3 hourly with term formula.
  - Start at 60mL/kg/day (7.5mL/kg/feed) if not contra-indicated.
  - If enteral feeding is not possible then admit to NICU and give 10% Glucose.
- Start at 60mL/kg/day (providing 4.2 mg/kg/min of glucose).
Hypoglycaemia

Glucose Monitoring of at Risk Infants

- Whole blood glucose (blood gas analyser) or plasma glucose (biochemistry lab) should be performed. Reagent strips should not be used for PGL monitoring for infants.
- For at risk infants, first sample done pre-second feed (3-4 hours of age).
- If infant feeding well and PGL ≥ 2.6mmol then repeat PGL 6 hourly (pre-feed) - if 2 consecutive PGLs are ≥ 2.6mmol/L then stop regular monitoring and test only if infant becomes symptomatic.

Investigation of Neonatal Hypoglycaemia - “Hypoglycaemia Screen”

If hypoglycaemia is persistent/recurrent (≥ 2 episodes), resistant to treatment, or glucose delivery rate is > 10mg/kg/min then investigate further (see below for hypoglycaemia screen).

<table>
<thead>
<tr>
<th>Hypoglycaemia Screen</th>
</tr>
</thead>
<tbody>
<tr>
<td>The critical blood samples <strong>MUST</strong> be collected at the time of hypoglycaemia, wherever safe, prior to commencing supplementation.</td>
</tr>
<tr>
<td><strong>DO NOT</strong> administer sucrose before heel stab/venepuncture.</td>
</tr>
<tr>
<td>• 1 mL of clotted blood and 1 mL of heparinised blood (2 small red top and 2 small green top tubes). Request insulin, cortisol, growth hormone, glucose, ketones or β-hydroxybutyrate.</td>
</tr>
<tr>
<td>• Blood gas analysis: lactate.</td>
</tr>
<tr>
<td>• The NEXT urine passed is important (aim for 5 mL urine). Request ketones, amino acids and organic acids.</td>
</tr>
</tbody>
</table>

Contact the Biochemical Genetics Unit for any queries regarding these investigations.
Management of Hypoglycaemia

### Asymptomatic Infants with PGL 1.5-2.5mmol/L

Needs paediatric RMO/ registrar review - consider “hypoglycaemia screen” and need for admission to SCN.

**Enteral Feeding**
- Start enteral feeding at 60-80mL/kg/day if no contra-indications.
- If persistent or recurrent hypoglycaemia, then increase feed volume to 12.5mL/kg/feed (100ml/kg/day).
- Consider more regular feeds (2 hourly).
- Admit to SCN if:
  - PGL remains between 1.5-2.5mmol/L despite the increased feeds.
  - Infant is symptomatic (lethargic with inadequate feeds, seizure).

### Asymptomatic Infants with PGL < 1.5mmol/L

Admit to SCN immediately for IV supplementation. If IV access is difficult, consider IM Glucagon while siting the IV.
- Take “hypoglycaemia screen” (above) if it does not delay treatment significantly.

### Symptomatic Infants – Seizures, Reduced Consciousness

**Admit to SCN for urgent IV supplementation.** If IV access is difficult, consider IM Glucagon while siting the IV.
- Take hypoglycaemia screen if it does not delay treatment significantly.

---

**Persistent Hyperinsulinaemic Hypoglycaemia of Infancy (PHHI)**

PHHI is commonly seen in infants born to a mother with gestational diabetes, however can occur in mothers with a normal glucose tolerance test. It is diagnosed by finding an elevated insulin level during a period of hypoglycaemia. Infants with PHHI may require a significantly higher glucose delivery rate of up to 10-12mg/kg/min.
AT-RISK INFANT
(GDM, PRETERM < 37 weeks, SGA, LGA, antenatal steroids > 34 weeks, maternal beta blockers)

Early enteral feed (< 1 hr of age)
- Breastfeed within 1st hour OR term formula 7.5mL/kg if not planning to breastfeed
- Feed 3 hourly or more frequently if demanding
- Perform pre 2nd feed PGL at next feed (3-4hrs)

PRE-FEED PGL

< 2.0mmol/L or symptomatic
- Contact RMO, reg, SR or ward consultant for individual plan
- Consider admission to SCN
- If PGL < 1.5mmol/L then admit to SCN

2.0-2.5mmol/L
(Breastfed Baby)
Glucose gel 0.5mL/kg and Breastfeed
If inadequate breastfeeding then give 7.5mL/kg term formula.
(Formula fed Baby)
Contact Paediatric RMO or registrar
Give 7.5mL/kg of term formula.

2.6mmol/L
(PGL prior to every 2nd feed (6 hourly))

PGL ≥ 2.6mmol/L
on 2 consecutive occasions

Cease monitoring

Random PGL < 2.6mmol/L AND NO RISK FACTOR
- Contact RMO, reg, SR or ward consultant for individual plan

PGL < 2.6 mmol/L
- Contact RMO, reg, SR or consultant for individual plan
- Consider increasing feeds to 10-12.5mL/kg.
- If <2.0mmol/L, consider admission to SCN

PGL ≥2.6mmol/L
- Continue with current management

Pre next feed PGL
